
What to do

1) think of relationship
2) " " how they interact

Added one Interface Property to common fields like CreatedDate, ModifiedDate.

Assumption

- 1 library
- User can only borrow 1 book for same book
- no expiry date

Scenario ⇒ So can design endpoints

1) Librarian / member look for book by certain genre / Name
2) librarian wants to check how many book left for that book (either total Qty or lend Out Qty)
3) Add Members / book / loanBook / bookStock ? should I delete bookStock if delete book ?
   - EF auto delete bookStock once book is deleted, since it is a child of book.
4) Delete
5) Update
6) Librarian look members by name / date
7) Student X borrows y books and when (LoanDate), also when he returned (ReturnDate) and how many total books he borrow
8) librarian wants to check how many Members !! (bonus)

Combine with book
